

Patriot3's U.S. Patent pending Multi-Purpose Tactical Ladder was developed to be a compact, lightweight and portable aluminum ladder system. The M-PTL can be used as a mobile ballistic barrier, standard straight ladder, A-frame ladder, field litter or a unique horizontal bridge. It can be transported easily using the Quick Release Carrier that integrates with the Improved Outer Tactical Vest.

## A-FRAME LADDER

The A-Frame Ladder configuration (6ft) provides the operator with a simple ladder option but with improved lateral stability. This configuration utilizes the Breaching Hooks to lock the ladder in position to provide a safe and solid structure.

## HANGING LADDER

The Hanging Ladder configuration (12ft) can be attached to any ledge by use of aluminum Breaching Hooks with serrations on the underside for maximum grip. The hooked ladder then hangs suspended vertically down the face of the obstacle. If a standard ladder is required, the Breaching Hooks can be removed.

## BRIDGING

The Bridging configuration (12ft) allows a fully geared operator to cross large gaps or obstacles safely. The Bridging Plates provide sure footing for the operator and the Pull Strap Y-Lanyard allows the bridge to be lowered into position from one side of the obstacle.

## QUICK RELEASE CARRIER

The Quick Release Carrier configuration allows the operator to securely transport 3 ladder sections and is compatible with the Improved Outer Tactical Vest. A steel pull cable allows the user to jettison the ladder in a hostile situation.

## MOBILE BALLISTIC BARRIER

The Mobile Ballistic Barrier configuration (6ft) provides the operator with ballistic and fragmentation protection. Two NIJ3A Ballistic Blankets attach to the ladder section and link together to form a large area of protection. The two Wheel Bracket Assemblies allow the barrier to be mobile for rapid repositioning or relocation.

## FIELD LITTER

The Field Litter configuration is a lightweight casualty transport system and also performs as a litter stand in the battlefield for medical procedures. The Ballistic Blankets act as the bed surface and includes four safety straps to secure the individual to the litter.
